ABSTRACT

It was estimated from World Health Organization (WHO) that most of the world population depends on herbal medicine for their health care. Azadirachta Indica A.Juss also known as neem plant is one of the most popular medicinal plants in Asia and Africa which was used from the ancient times for many medicinal purposes. It is used in many traditional remedies because of its richness with biological active constituents. Some of these chemical constituents are Nimbidin, Nimbin, Nimbolide, Gedunin, Azadirachtin, Mahmoodin, Cyclic trisulphide and others which are used as antipyretic, anti-inflammatory, antibacterial, antiarthritic, spermicidal antifungal, diuretic and antitumour. Traditionally different parts of the plant are used by populations from many countries for the treatment of several diseases such as leprosy, epistaxis, eye problem, elimination of intestinal worms, anorexia, skin ulcers, biliousness, skin diseases like ringworms, burning sensation, wounds and itching. It is also used as analgesic, alternative and curative of fever and urinary disorder. In addition, it is used in the treatment of cough, asthma, phantom tumour, spermatorrhoea, diabetes, blood morbidity, biliary afflictions and many more medicinal values. The present work provides comprehensive information on the traditional use value and the chemical constituents of Azadirachta Indica in order to explore the therapeutic potential, highlight the relation between the traditional use value and the chemical constituents and the scientific future research opportunities on Azadirachta Indica.

Keywords: Azadirachta Indica, Neem, Traditional remedies, Phytochemistry, Pharmacology.

INTRODUCTION

Human society used the medicinal plants to combat diseases, since the dawn of civilization (1). A number of alternative medicine systems exist in the eastern region of the Mediterranean (2). For thousands of years nature has been a source of medicinal agents and based on their uses in traditional medicine an impressive number of modern drugs have been isolated from natural sources (3). In fact, plants are rich source of different types of medicines because they produce a diverse range of bioactive molecules (4). In the pharmaceutical industries natural products play an important role in drug development programs, therefore, over 50% of all modern clinical drugs are of natural product origin (5). In the addition of the importance of synthetic medicinal chemistry, there is huge interest in herbal medicine, there has been a revival of interest in herbal medicines to control major diseases and to discover new molecular structures as lead compounds from the plant kingdom (6).

Azadirachta indica A.Juss. Arabic names are nim and nem while the English names are Persian liac, neem tree, bastard tree, Indian liac, bead tree, margosa tree, cornucopia and Indian cedar. This plant described in 1830 by De Jussieu (7) and taxonomically classified as shown in table 1 (8).

Table(1): Classification of Neem plant (51).
Azadirachta indica A. Juss. is a tree of small to medium-sized around 18 m, tall up to 15-30 m, with large crown up to 10-20 m diameter (9). The leaves are light green simply pinnate alternate with 20-40 cm long. The flowers are pentameric, small, white or pale yellow, slightly sweet and bisexual. The plant's fruits are greenish yellow to yellow or purple and have one or two seeded drupe, ellipsoidal, 1-2 cm long. They are greenish when ripe and their seeds are ovoid or spherical (10). Neem’s leaves, seeds, bark, roots, fruits and oil have become a cynosure of modern medicine and used medicinally for treatment various diseases specially in Indian Ayurvedic medicine, Homoeopathic medicine and Unani (11).

This plant was used for centuries by many cultures for their medicinal values. The advantages of this plant (very popular in many Asian and African countries) are easily available, cheap and low toxicity (12). Azadirachta indica is commonly known as Neem. It has great medicinal values and distributed widespread in the world. It is native of India and naturalized in most of tropical and subtropical countries. Their uses and attribution as one of medicinal plants is due to its various different active compounds which can be extracted from each of its parts (13, 14). This review stated a detailed description on the existing chemical constituents and traditional uses of Azadirachta indica (neem) tree.

Method of Data Extraction

The procedure of collecting the available information on Azadirachta indica was via library search for articles published in peer-reviewed journals and ethnobotanical textbooks, as well as via electronic search (using Google Scholar, Pubmed, Web of Science, Scopus, and other web search engines).

Chemical Constituents

Neem (Azadirachta indica) elaborates a vast array of biologically active compounds which are structurally complex and chemically diverse (15, 16). Every part of this plant is used as herb (13, 17). During the past two decades, the chemical constituents and biological activities of Azadirachta indica were intensively investigated in both developing and developed countries. Several published studies revealed a lot of biological compounds (Azadirachtin M and Azadirachtin N) and effects of these compounds on insects, and other inhibitory activities such as antitypanosomal and antiprotozoal (18, 19). Siddiqui et al., (2009) extracted different constituents from the flowers of Azadirachta indica and analyzed their insecticidal activity, they found around 38 compounds in the flowers with insecticidal activity (such as: n-Hentriacontane, n-Nonacosane, n-Pentacosane, 2-Methoxy-5,40-dimethylbenzenebutanal, Methyl octadecanoate acid, etc) (20). The group of tetranortriterpenoids, especially azadirachtin analogues is responsible for most of the active principles as it has many antiinfective and antimicrobial properties (21).

The extracted chemical constituents of different parts of neem tree contained many biologically active compounds, including triterpenoids, alkaloids, phenolic compounds, flavonoids, carotenoids, ketones and steroid. The most biologically active compound is azadirachtin. This compound belongs to the C-seco limonoids which was classified as tetranortriterpenes (22). It is actually a mixture of seven isomeric compounds labelled as azadirachtin M and azadirachtin N (Figure 1).
These two compounds is more effective and play major role in medicinal activities when compared against second-instar larvae (L2) of Plutella xylostella L (23).

The structure of chemical compounds of *Azadirachta indica* is complex. Therefore, many years of study and research were done to elucidate the exact structure of azadirachtin. In 1968 Azadirachtin was first isolated by Butterworth and Morgan (24). Since that, more than 100 related compounds had been isolated from the neem tree, and these could be assigned to one of three groups: azadirachto1s, azadirachts, and meliacarps (Figure 2) (25, 26).

The Neem oil comprised of the bitter principles which was formed from biologically active compounds that were isolated from different parts of the plant including meliacin, azadirachtin, gedunin, nimbin, nimbolides, salanin, meliacin and valassin (27). Besides, the seeds also contains tignic acid responsible for the distinctive odour of the oil (17, 28). Around 30-50 % of the oil was extracted from neem kernels. This oil mainly used as pesticide, soap and by pharmaceutical industries and contain many active ingredients which are together called triterpene or limonoids (29).

The four best limonoids compounds were included Azadirachtin, Salannin, Meliantriol, and Nimbin. Limonoids contain insecticidal and pesticidal activity (30) which lead to its role as an antifeedants, repellents, growth inhibitors, attractants, chemosterilants or as insecticides (Figure 3) (14, 31).

The phytochemistry screening of Neem samples from leaves extracts also revealed some different chemical constituents compared to other plant parts. The obtained results showed the presence of tannins, saponins, flavonoids, alkaloids, glycosides, reducing sugars, polyphenols, HCN and terpenes in the ethanolic leaf extract (32, 33). The ethanolic extract of neem’s leaves was also showed the composition of fibres,
vitamins and micronutrients. The study proved that *A. indica* contains high fibre content which was 20.11 ± 0.45%, but low protein composition which is 13.42 ± 0.12% (32).

Apart from that, the investigation of the chemical composition of essential oil isolated from leaves was further analyzed using GC/MS. Analysis of volatiles of leaves was determined that thirty two compounds were identified, which represented 84.98 % of total oil. The oil contains ketones, terpenes and phenolic esters (17).

**TRADITIONAL USES**

In many parts of the world, the herbal remedies from medicinal plants are used traditionally, but their access to formal healthcare are limited (34). World Health Organization (WHO) has estimated that as many as 80% of world’s population rely on herbal traditional medicines as their primary health care (34). This means that the use of natural products as medicine has been widely practiced through folklore from ancient time in world up to now (35, 36). Over 3000 years the neem tree is well known in India and its neighboring countries. It was one of the most versatile medicinal plants having a wide spectrum of biological activities and the following are the commonly used forms of the plant in more than 50 countries. The tree parts are used against various human ailments as traditional medicine for household remedy (12, 37). This tree was usually used as natural pesticide, planting and afforestation as shade trees and to protect against erosion, and definitely as medicinal plants (38).

*Azadirachta indica* is a very useful traditional medicinal plant in the African sub-continent. Each part of the tree has some medicinal properties which can be used to treat several of diseases (39, 40). The plant is widely cultivated in Nigeria as a decorative and medicinal plant. However, it is quite native to Asia, but has now naturalized in West Africa. It is used extensively in Nigeria for the traditional treatment of malaria and other associated conditions in form of consumption with unspecified quantities without due regards to its toxicological and other adverse effects. This way of consumption is termed as decoction (41). Based on this traditional and other uses of *Azadirachta indica*, a lot of studies was conducted to ascertain its potentially pharmacologically active components and pharmacological activities (33, 42).

Pakistan as most developing countries has a valuable heritage of herbal remedies (43). Its rural population still depends on the indigenous system of medicine to a great extent that is because herbal medicines have the advantages of being readily available and economical. In addition, the local practitioners claim that these remedies frequently have fewer side effects. Therefore, because some of herbal drugs are commonly used by traditional practitioners, it was considered to be of interest to evaluate and determine the efficacy of for their antipyretic effects (44). Besides its therapeutic efficacies, neem has already established its potential as a source of naturally occurring pesticide, insecticide, and agrochemicals as it showed oviposition deterrence, antifeedant effect on larvae, and toxicity to eggs and larvae of the beet armyworm (45).

In India, the Neem tree twigs are commonly used to scrub teeth. Moreover, the neem tree branches are used as one of the most effective forms of dental care in traditional medicines; even though, it seems a little bit unpleasant for the users (46). Interestingly, the neem trees are an excellent alternative for modern tooth care products. Besides, the leaves of the neem tree are also used as natural treatment for acne sufferers (47). Similarly, treatment of infected eyes can be carried by the use of neem leaves. A similar infusion can also be used in the treatment of sore throats (12).

All parts of neem trees including leaves, seeds, roots, bark and the flowers of the plant are used to cure different ailments, such as stomach ulcers, jaundice and to overcome a variety of infectious and parasitic diseases, ranging from leprosy, chicken pox, and malaria. Infusions and teas made from leaves are used to alleviate malaria attacks, intestinal complaints, treat dental, headache, stimulating the appetite, heartburn and as insects repellent, in addition to that it was also used as a diuretic and for diabetes, also other febrile illnesses as well as to treat...
numerous skin diseases (48). The use of aqueous extracts from seeds to treat head lice is widely known. Neem oil showed good antiseptic properties. It is applied in the treatment of such skin complaints as furuncles and eczema, as well as to relieve intestinal worm infections (38). Apart from that, neem-based products from *Azadirachta indica* are traditionally used for pest control in agriculture and gardening since long in India (49, 50).

**CONCLUSION**

Historical evidences showed the relation between humankind and neem tree and also it showed neem application in health care systems from ancient times to the modern medicine. It has portrays a clear description of neem tree and its broad biopotential activity. It has provided a new vision into the exploration and utilization of neem tree as a source for development of new therapeutic molecules.
